SUBJECT: Lithium Reanalysis – HW25 18 July 2012
Dimock, PA

FROM: Dawn A. Ioven, toxicologist
Technical Support Branch (3HS41)

TO: Rich Fetzer, OSC
Eastern Response Branch (3HS31)

Samples initially collected from residential wells in Dimock during Weeks 1 through 4 were recently reanalyzed to achieve lower detection limits for lithium. Findings for HW25 are presented below.

Lithium

Lithium was reported in tap samples collected from HW25 at respective concentrations of 48.3 and 51.1 ug/L (unfiltered and filtered). These concentrations exceed lithium's risk-based screening level of 31 ug/L; long-term exposure to the unfiltered tap concentration of lithium (48.3 ug/L) would generate a Hazard Quotient of 1.6. Under acute exposure conditions, ATSDR has suggested a screening concentration of 1500 ug/L for lithium in drinking water.
